10. **Compressor Protection**
There is a Time Delay program within the microprocessor. This prevents a heavy load from being applied on the Compressor Motor when restarting the unit (Cool Mode) after a very short period of time. This “delay” is in effect any time when the compressor is turned on by either the “Cool On/Off” button, temperature set point (thermostatic control), power interruption restart or Condensate Pump (optional) operation.

Time Delay Program Specifications: $65 \pm 10$ sec.

11. **Temperature Control**
The compressor operation (Cool Mode) is controlled by the microprocessor which receives input signals from the room temperature thermostor (evaporator inlet air) and the setting of the Temperature Set Point. The Temperature Set Point (desired room temperature) can be adjusted by pressing the ▲ / ▼ buttons on the Control Panel. The adjustment range of the Temperature Set point is 65˚F to 90˚F (18˚C to 32˚C).

12. **Fan Mode Control Switch**
The fan motor operation is controlled by relays on the relay board through a microprocessor in the control panel assembly. The fan program in the microprocessor can be changed by a DIP-Switch on the left side of the Relay Board located in the Control Box. There are two settings:

A. **Cool to Stop**
   When the DIP-Switch is set to the down or “Stop” position, the microprocessor controls the fan motor using the same room temperature thermostor that it uses to control the compressor. In this case, both the fan and the compressor stop when the microprocessor receives a sufficiently low intake air (room temperature) signal from the thermostor (equal to or less than the set point). When the temperature increases (exceeds the set point) the microprocessor will restart the fan and compressor automatically. However, if the unit has been off for less than 75 sec., the fan will start before the compressor (time delay program).

B. **Cool to Operate**
   When the DIP-Switch is set in the up or “Operate” position, the microprocessor controls the fan operation using control panel inputs only. The fan will operate continuously during Fan Only and Cool Modes. (This is the “Factory Default” setting.)

13. **Temperature Scale Display Switch**
When the DIP Switch is set in the “down” or °C position, the Set Point and Room Temperature will be displayed in degrees Celsius (°C). The LED that indicates °C will also be illuminated.

When the DIP Switch is set in the “up” or °F position, the Set Point and Room Temperature will be displayed in degrees Fahrenheit (°F). The LED that indicates °F will also be illuminated (this is the “factory default” setting).
Before troubleshooting the system, the following inspection should be performed.

1. **Inspection of Power Source Voltage**  
   Check the voltage of the power source.  
   Single phase 230 volts (60Hz)  
   Check the operation and condition of the fuse or circuit breaker in the power source.

2. **Inspection of Air Filters**  
   Remove the air filters and check the element. If the element is dirty, wash it as described in the OPERATION MANUAL supplied with the unit.

3. **Inspection of Drain Tank**  
   Be sure tank is fully drained.  
   The following chart is provided as a guide for categorized problem remedies. Detailed information is contained in the OPERATION MANUAL supplied with the unit.

4. **Troubleshooting Chart**

In case of trouble, perform the following inspection before disassembly.

5. Inspection of Plate Fins
To inspect the plate fins of either the evaporator or condenser you must remove the air filters. After removal of the air filters, inspect the plate fins for any dirt, dust, lint, or debris that may have caused poor cooling performance of the unit. If cleaning of the fins is necessary, it is recommended that this service be performed by a qualified service technician.

6. Examination of Operating Environment
Operating environments will vary depending on location, climate and surrounding conditions. Installation location also can cause operational problems. Consult your reseller concerning operational environment requirements.

7. Inspection of Cooling Capacity
Measure the difference in temperature between the inlet of the evaporator and the cool air vent. If the difference is out of the range given in the graphs on page 8, proceed with the possible causes suggested in the troubleshooting chart on page 19.
8. Disassembly

Figure 5-4: Disassembly
A. Remove drain tank.

B. Remove four (4) screws from upper front panel.

C. Slide upper front panel forward and remove.
D. Louver can be removed from upper front panel by unsnapping the lock tap and removing the louver from its pivots.

E. Remove four (4) screws from service panel.

F. Disconnect the three (3) lead wires of the power cord.
9. Removal of Electrical Parts

G. Remove thirteen (13) screws from rear panel.
H. Remove ten (10) screws (eight shown) from upper rear panel and two (2) screws on top.

Figure 5-11: Removal of Back and Upper Rear panel Screws
Figure 5-13: Connections to Relay Board

Figure 5-14: Connections to Control Board
10. Removal of Blower Assembly
A. Remove the ring sub-assy

B. Loosen the set screw using an allen wrench and then remove the centrifugal fan.

C. Remove the two (2) nuts “A” on the inside of the housing in the locations shown. Then remove the blower housing (condenser).
   A - NUT

D. Remove the two (2) nuts “A” and two (2) screws “B” as shown. Then remove the motor bracket together with the fan motor.
   A - NUT
   B - SCREW
E. Remove the centrifugal fan by loosening the set screw on the shaft. Remove the fan motor by loosening nuts “A”.

F. Remove seven (7) screws from left side panel.

G. Remove seven (7) screws from right side panel.

H. Remove lower air deflector
I. Remove two (2) screws from the control panel stay.

J. Remove two (2) screws from the control panel stay.

K. Disconnect the following connectors from the control board:
   (A) Wire Harness, Relay Board to Control Board J201 (10-pin)
   (B) Drain Tank Switch J103 (2-pin)
   (C) Room Temperature Thermistor J101 (2-pin)
   (D) Freeze Thermistor J102 (2-pin)
   (E) High Pressure Switch Sub-Harness

   **NOTE:** Mark each of the 2-pin connectors with a different color marker to ensure the correct orientation when they are re-connected.

L. Remove the five (5) screws from the control panel stay.
board on the control panel assembly. Remove the control board.

11. Inspection of Capacitor (for Fan Motor and Compressor)
Ohmeter Method – Set the ohmeter to the 100KΩ range. Place the two probes against the two terminals of the capacitor. At first, the ohmeter should indicate 0Ω, then the reading should gradually increase towards infinity (∞). This indicates that the capacitor is charging. If the reading indicates infinity right away (shorted) or the ohmeter fails to move from 0Ω (open), replace the capacitor.

12. Capacitance Tester Method
Using a capacitance tester and the chart on page 15, test the capacitor for the value indicated. If the value tested is not within 10% of indicated capacitance, replace the capacitor.

⚠️ WARNING: Properly discharge the capacitor(s) before testing and after testing has been completed. Failure to do so could cause damage to test equipment or the unit and/or result in personal injury (electrical shock) or death.

13. Inspection of Drain Switch
Check for continuity between terminals 1 and 2. Continuity should exist. With switch depressed, no continuity should exist between terminals 1 and 2. If continuity is not as specified above, replace the switch.

14. Inspection of Fan Motor
Measure resistance across the terminals of the fan motor:

<table>
<thead>
<tr>
<th>Terminals (at 77°F (25°C))</th>
<th>Resistance</th>
</tr>
</thead>
<tbody>
<tr>
<td>J6-CF1</td>
<td>Approx. 6.8</td>
</tr>
<tr>
<td>J5-CF1</td>
<td>Approx. 14.8</td>
</tr>
<tr>
<td>CF1-CF2</td>
<td>Approx. 19.4</td>
</tr>
</tbody>
</table>

If the measured resistance is not equal to these standard values, replace the fan motor.
15. Inspection of Compressor Motor

Measure resistance across the terminals of the compressor motor.

Terminals (at 77°F (25°C))
R-C Approx. 2.0Ω
C-S Approx. 2.2Ω
S-R Approx. 3.8Ω

If the measured resistance is not equal to these standard values, replace the compressor.

16. Inspection of Wiring Connection

Refer to the Wiring Diagrams on page 39 and check for connection of each wire.

17. Inspection of Thermistor

Using an Ohmeter, check the resistance value across the 2-pin connector. At normal temperature (77°F (25°C)) either thermistor (room or freeze) should measure approximately 10,000 or 10K ohms.

18. Inspection

In most cases, the probable cause for insufficient cooling is a clogged system, too much static pressure leakage or an incorrect amount of refrigerant. In such cases, inspect the system according to the following procedure.

A. Inspection of Clogged System

Check the component parts of the refrigerant system, including piping, that could be clogged with refrigerant. If clogged with refrigerant, only the clogged part is frosted partially. In such a case, change the part in question.

B. Inspection of Refrigerant Leak

Carefully check all connections, and each component for leaks whenever the refrigerant system is installed or repaired. Use an electronic gas leak tester to inspect the system.

C. Insufficient Refrigerant

In case the unit is judged to be deficient in cooling capacity, be sure to perform the inspections in 18A and 18B to confirm the cause of trouble. After that, charge the system with refrigerant to the specified amount.
19. Repair of Refrigerant System

In case there is a leak, obstruction, or trouble in the refrigerant system of the Spot Cooling System, replace or repair the part in question. After replacing any component all connections must be brazed.

A. Proper Brazing Techniques

It is desirable to use a slightly reducing flame. Oxyacetylene is commonly used since it is easy to judge and adjust the condition of the flame. Unlike gas welding, a secondary flame is used for brazing. It is necessary to preheat the base metal properly depending on the shape, size or thermal conductivity of the brazed fitting.

The most important point in flame brazing is to bring the whole brazed fitting to a proper brazing temperature. Care should be taken to not cause overflow of brazing filler metal, oxidization of brazing filler metal, or deterioration due to the overheating of flux.

• BRAZED FITTING AND ITS CLEARANCE

In general, the strength of brazing filler metal is lower than that of the base metal. So, the shape and clearance of the brazed fitting are quite important. As for the shape of the brazed fitting, it is necessary to maximize its adhesive area. The clearance of the brazed fitting must be minimized to facilitate brazing filler metal to flow into it by capillary action.

• CLEANING OF BRAZING FILLER METAL AND PIPE

When the refrigerant system has been opened up, exposure to heat may have caused brazing filler metal to stick to the inside and outside of the pipe. Brazing filler metal may also be compounded with oxygen in the air to form oxide film. Fats and oils may stick to the pipe from handling. All these factors will reduce effectiveness of brazing. It is necessary to eliminate excess brazing filler metal using sand paper and by cleaning thoroughly with a solvent such as Trichlene.

• USE OF DRY NITROGEN GAS

During brazing, the inside of the pipe undergoes an oxidative reaction due to the brazing flame. Introduce dry nitrogen gas (1 l/min.; adjust with the flow regulator) through the pinch-off tube of the refrigerant cycle to prevent oxidation.

NOTE: Take care not to allow dirt, water, oil, etc. to enter into the pipe

• VERTICAL JOINT

Heat the whole brazed fitting to a proper brazing temperature. Bring the brazing filler metal into contact with the fitting so that the brazing filler metal starts flowing by itself. Stop heating the fitting as soon as the brazing filler metal has flown into the clearance. Since the brazing filler metal flows easily into the portion heated to a proper temperature, it is essential to keep the whole fitting at a proper brazing temperature.
B. Removal of Refrigeration Cycle Components

⚠️ CAUTION

1. Before any refrigeration cycle component can be replaced, it is necessary to recover the refrigerant using standard recovery procedures and equipment.
2. To prevent oxidation, dry nitrogen should be conducted (flow rate 1l/min) through the pinch-off tube during any brazing operation.
3. During any component replacement involving brazing, shield nearby parts with a steel plate, asbestos, etc., to protect them from the flame.

(1) Evaporator
(2) Capillary tubes
(3) Condenser
(4) Compressor

**NOTE:** Hold the compressor body, not the tube, when carrying the compressor.
20. Charging the System with R-22 Refrigerant

Always ensure that the refrigerant system has been properly evacuated before charging with the specified amount of R-22.

**WARNING**

When handling refrigerant (R-22), the following precautions should always be observed:
- Always wear proper eye protection while handling refrigerant.
- Maintain the temperature of the refrigerant container below 40˚C (104˚F).
- Perform repairs in a properly ventilated area. (Never in an enclosed environment.)
- Do not expose refrigerant to an open flame.
- Never smoke while performing repairs, especially when handling refrigerant.
- Be careful the liquid refrigerant does not come in contact with the skin.

If liquid refrigerant strikes eye or skin:
- Do not rub the eye or the skin.
- Splash large quantities of cool water on the eye or the skin.
- Apply clean petroleum jelly to the skin.
- Go immediately to a physician or to a hospital for professional treatment.

### A. Connection of Gauge Manifold

1. Properly remove the crushed end of the pinch-off tube at the high pressure side and the low pressure side of the refrigerant cycle with a pipe cutter.

2. Fit the process tube fitting to the pinch-off tube on both sides.
B. Evacuation

(1) Open the high pressure valve (HI) and the low pressure valve (LO) of the gauge manifold.

(2) Turn on the vacuum pump to start evacuation. (Evacuate the system for approximately 15 minutes.)

(3) When the low pressure gauge indicates 750 mmHg (29.55 in.Hg) or larger, turn off the vacuum pump and close the high and low pressure valves of the gauge manifold.

C. Checking Vacuum

(1) Leave the high pressure valve and the low pressure valve of the gauge manifold closed for five minutes or more, and confirm that the gauge pointer does not return to zero.

(2) If the gauge pointer returns gradually to zero, there is a leak somewhere in the system (this could also include gauge manifold). Perform leak check according to procedure indicated in 20D. Once leak has been found and repaired evacuate the system once more, and confirm system holds vacuum.
D. Checking Gas Leak

(1) Remove the charging hose (green) from the vacuum pump, and connect the hose to the refrigerant cylinder (R22).

(2) Loosen the nut on the gauge manifold side of the charging hose (green).

(3) Open the high pressure valve of the gauge manifold. Charge the system with refrigerant until the low pressure gauge indicates 57 PSIG. (4 kg/cm²G.) After charging is complete, close the high pressure valve.

(4) Check carefully for gas leaks inside the refrigerant system using the gas leak tester.

(5) Repair any leak.

⚠️WARNING: Do not attempt any repair on a charged system.

E. Evacuation (Repeat)

(1) Close the valve of the refrigerant cylinder. Then remove the charging hose (green) from the refrigerant cylinder, and connect it to the refrigerant recovery machine.

NOTE: Keep the high pressure valve and the low pressure valve of the gauge manifold closed.

(2) Using procedure 20B., evacuate the system until the low pressure gauge indicates 750 mmHg (30 in. HG) or greater. (For 15 minutes or more.)

(3) After evacuation is complete, close the high and the low pressure valves of the gauge manifold.

⚠️CAUTION: Be sure to evacuate the system twice or more using the repetitive vacuum method. Evacuate the system an additional time on rainy or humid days.

⚠️WARNING: Before checking for gas leaks, fully confirm that there is nothing flammable in the area to cause an explosion or fire. Contact of refrigerant with an open fire generates toxic gas.
21. Refrigerant Charging Work

A. Refrigerant Charging

(1) Remove the charging hose (green) from the vacuum pump, and connect it to the refrigerant cylinder (R-22).

(2) Loosen the nut on the gauge manifold side of the charging hose (green). Open the valve of the charging hose (green). Open the valve of the refrigerant cylinder.

(3) Securely place the refrigerant cylinder on a scale with a weighing capacity of 70 lbs (30 kg) that is graduated by 0.2 oz (5 g).

(4) Open the high pressure valve of the gauge manifold and the valve of the refrigerant cylinder. Charge the system with refrigerant to the specified amount.

Standard Amount of Refrigerant: 15.2 oz / 2.17 lbs (960g)

If the system cannot be charged with the specified amount of refrigerant under this condition, follow the steps below:

(a) Close the high-pressure valve of manifold.

(b) Operate the refrigerant system.

(c) Slowly open the low-pressure valve while observing the scale reading.

(d) When the scale reads the specified amount, immediately close the low-pressure valve.

(e) Bring the system to a stop.

⚠️ CAUTION: The amount of refrigerant charged has a great effect on the cooling capacity of the unit. Charge to the specified amount, always observing the scale graduations while charging.

(5) Close the high pressure valve of the gauge manifold and the valve of the refrigerant cylinder.
B. Removal of Gauge Manifold

1. Crimp the pinch-off tube with a pinch-off tool.
2. Remove the gauge manifold and the process tube fitting. Crush the end of the pinch-off tube.
3. Braze the end of the pinch-off tube.
4. Ensure that a gas leak is not present at the pinched off portion and the brazed end.

Reassemble the unit in the reverse order of removal. Described below are the parts that require special care in reassembling the unit. Perform all wiring or rewiring as referenced in the wiring diagram.

22. Compressor Mounting
Mount the compressor on the frame, using cushions, steel collars, spring washers, plate washers and nuts.

23. Blower Assembly
Install blower fans (for evaporator and condenser).

Tightening torque:
10.84 ± 2.17 lbf•ft (150 ± 30 kgf•cm)

24. Wiring Notice
Secure the wires using clamps so that they do not come into contact with the edges of the structure, etc. Secure the wires using clamps in the same position they were before removal.

25. Perform the inspection of cooling capacity and check for abnormal noise or abnormal vibration.
26. Schematic

Figure 5-48: Wiring Diagram
